

Two systems, one platform. Here is how we would build them.

Summary view
Full plan available on request

Thanks for sending this through. Reading it, the first system is really about **trust** rather than search, and the second is about **control** rather than automation. Both sit on one shared foundation, so each works on its own without you ever maintaining two contact lists.

WHAT WE WOULD BUILD

1

Executive Intelligence Assistant

Answers only from your documents

Finds the answer

Searches only what that person is allowed to open.

Cites the page

Every sentence points to a document and page number.

Flags contradictions

Spots when two documents disagree on a figure, date or term.

Tracks what is missing

Shows the evidence a decision still needs before it can be taken.

Says when it does not know

Declines rather than guessing. This matters more than it sounds.

2

CRM + Follow-up

Nothing sent without a person

Three relationship types

Investors, partners and counterparties, customers and members.

Stages you configure

Including a GCC path: introduction, majlis, NDA, MoU, approval.

Follow-ups that surface

Overdue and dormant relationships reach management, not the contact.

Approval gate on every message

Enforced in the database, not the screen. Drafter cannot self-approve.

Reporting that reconciles

Who was contacted, what stage, what is overdue.

BUILT ONCE, SHARED BY BOTH — AND BY ANYTHING YOU ADD LATER

Single sign-on
& roles

One list of
people & firms

Document
store

Swappable
AI gateway

Workflow
& reminders

Tamper-proof
audit trail

It shows its work

Answers carry their sources, and a second pass deletes anything the sources do not support.

A person always decides

There is no automated sending path anywhere in the code, not even one switched off.

Yours from day one

Your cloud account in a GCC region. You own the code, the accounts and the data.

WHERE WE WOULD GO BEYOND THE MINIMUM

RETRIEVE INFORMATION

Permissions applied **inside** the search, so it never reads what the user may not open.

FLAG CONTRADICTIONS

A **claims ledger**: every figure and date compared across the whole set, not just a search result.

TRACK MISSING INFORMATION

Decision checklists you define once, plus documents referenced but never supplied.

ANSWER IN PLAIN LANGUAGE

A **grounding check** that deletes unsupported sentences. Arabic and English, including scans.

CONTACT RECORDS

A counterparty in a contract is the **same record** as the relationship in your pipeline.

FOLLOW-UPS

Dormant relationships surfaced automatically, so nothing goes quiet unnoticed.

HUMAN APPROVAL

A **four-eyes rule** in the database, risk flags at submission, full version history.

BASIC REPORTING

A **hash-chained audit trail**, exportable if internal audit or a regulator ever asks.

HOW IT WOULD LAND

Week 6

Working structure of both systems

Week 8–9

Integrated demo: contradictions and approvals working

Week 9–15

Pilot on your real documents

Week 20

Production go-live

YOUR FOUR QUESTIONS, ANSWERED SHORT

Tools

One platform, two products, on standard parts. AI models sit behind a gateway, so **no vendor is load-bearing**.

Your data later

By configuration, not code. Import templates, connectors, and demo data that **clears in one action**.

Timeline

Demo at **week 8–9**, production at week 20. A clickable version on sample documents at week 4 if it helps.

Cost

Fixed fee per milestone. Cloud and AI billed in your name at cost, **a few hundred a month** during the pilot.

WHAT WOULD HELP US MOST FROM YOU

MOST USEFUL

Sample documents

50 to 200 under NDA. Ideally your worst scans, not your tidiest files.

SHAPES THE BUILD

Decisions you make often

Five to ten, and the evidence you expect for each.

CHANGES THE COST

Where data may live

Which countries, and whether text may be processed outside them.

USEFUL

Platform details

Cloud region, staff login, and the mailbox approved messages go from.

USEFUL

How you work today

Real pipeline stages, who approves outreach, any existing CRM.

The full plan is ready whenever you are: architecture, timeline, and a cost model with every assumption visible.

An hour covers it comfortably, with no obligation attached. We are equally happy to answer anything here in writing first.
